**PREVALENCE OF PNEUMOCYSTIS JIROVECI PNEUMONIA (PCP) IN
HIV PATIENTS AT LABUANG BAJI HOSPITAL MAKASSAR CITY**

ABSTRACT

Background: *Pneumocystis Jiroveci Pneumonia (PCP)* is one of the opportunistic infections that is often found in HIV patients with weakened immune systems. This infection can cause serious complications and has a high mortality rate. This study aims to determine the prevalence of PCP in HIV patients based on age, gender, and HIV stage at Labuang Baji Hospital, Makassar City. **Objective:** to determine the prevalence of *Pneumocystis Jiroveci Pneumonia (PCP)* in HIV patients at Labuang Baji Hospital, Makassar City **Method:** This study is an analytical observational study with a cross-sectional approach. This study uses secondary data, namely medical record data. **Sample:** The sample is part of the entire object being studied and is considered to represent the entire population. In this study, samples were taken using a non-probability sampling technique, namely purposive sampling. **Research Results:** Based on data collected from a total of 50 patients, it was found that the highest PCP-HIV sufferers were aged 31-40 years, as many as 25 people (36.8%). PCP-HIV sufferers based on gender were highest in men as many as 42 people (62.3%). PCP-HIV sufferers based on the highest stage were at stage 4 as many as 29 people (42.6%). The results of the analysis test using the Chi-Square method showed a p value of 0.001 where $p < 0.05$. **Conclusion:** The highest in the 31-40 year age group, the highest in the male gender and the highest in stage 4.

Keywords: *Pneumocystis Jiroveci Pneumonia (PCP), HIV, Prevalence, RSUD Labuang Baji*
